This is an example header named [example_head-38618812.tex](#).

1. (15 pts)

This is an example problem named [example_problem_template-38618812.tex](#).

Determine the product of 5 and 8.

SOLUTION

$$5 \times 8 = 40$$

The serial number is 38618812. This is labeled as question number 1.

2. (16 pts)

This is an example problem named [example_problem2_template-38618812.tex](#).

Determine the quotient of 3.1 and 359.0.

SOLUTION

$$3.1 \div 359.0 = 0.009$$

The serial number is 38618812. This is labeled as question number 2.

3. (17 pts)

Superheated steam at 3 MPa and 359.0°C is to be converted to saturated steam at 3 MPa in a desuperheater. This desuperheater is supplied with inlet liquid water at 53.0°C. The unit should produce saturated steam at a rate of 44.0 kg s^{-1} . Assuming adiabatic operation, and assuming the liquid inlet is saturated, what is the mass flowrate of the inlet water?

The following enthalpies will be useful:

Superheated steam at 359.0°C and 3 MPa: $\hat{H} = 3,133.95 \text{ kJ/kg}$;

Saturated liquid water at 53.0°C: $\hat{H}^L = 221.87 \text{ kJ/kg}$; and

Saturated water vapor at 3 MPa: $\hat{H}^V = 2,803.84 \text{ kJ/kg}$.

SOLUTION

Let stream 1 be the liquid water stream, which we assume is saturated liquid, stream 2 be the superheated steam inlet, and stream 3 be the saturated steam outlet. Hence, $\dot{m}_3 = 15 \text{ kg s}^{-1}$ as given. The mass and energy balance yield the two unknowns \dot{m}_1 and \dot{m}_2 :

$$\begin{aligned}\dot{m}_1 + \dot{m}_2 &= \dot{m}_3 \\ \dot{m}_1 \hat{H}_1 + \dot{m}_2 \hat{H}_2 &= \dot{m}_3 \hat{H}_3\end{aligned}$$

Solving these two simultaneously yields

$$\begin{aligned}\dot{m}_1 &= \dot{m}_3 \left(\frac{\hat{H}_2 - \hat{H}_3}{\hat{H}_2 - \hat{H}_1} \right) \\ &= (15) \left(\frac{3,133.95 - 2,803.84}{3,133.95 - 221.87} \right) = \boxed{4.99 \text{ kg s}^{-1}}.\end{aligned}$$

This is an example tail named `example_tail.tex`.
